# NUNC Labware

## Chemical Resistance Chart

### Interpretation of Chemical Resistance

The Chemical Resistance Chart that follows is a general guide only. Because so many factors can affect the chemical resistance of a given product, you should test under your own conditions.

### Effects of Chemicals on Plastics

Chemicals can affect the strength, flexibility, surface appearance, colour, dimensions or weight of plastics. The basic modes of interaction which cause these changes are: (1) chemical attack on the polymer chain, with resultant reduction in physical properties, including oxidation; reaction of functional groups in or on the chain; and depolymerization; (2) physical change, including absorption of solvents, resulting in softening and swelling of the plastic; permeation of solvent through the plastic; dissolution in a solvent; and (3) stress-cracking from the interaction of a "stress-cracking agent" with molded-in or external stresses. Also see "Chemical Resistance Classification."

Mixing and/or dilution of certain chemicals in NUNC labware can be potentially dangerous.

The reactive combination of different chemicals or compounds of two or more classes may cause an undesirable chemical effect or result in an increased temperature which can affect chemical resistance (as temperature increases, resistance to attack decreases). Other factors affecting chemical resistance include pressure and internal or external stresses (e.g. centrifugation), length of exposure, and concentration of the chemical.

### Environmental Stress-Cracking

Environmental stress-cracking is the failure of a plastic material in the presence of certain types of chemicals. This failure is not a result of chemical attack. Simultaneous presence of three factors causes stress-cracking: tensile stress, a stress-cracking agent and the inherent susceptibility of the plastic to stress-cracking.

Common stress-cracking agents are detergents, surface active chemicals, lubricants, oils, ultra-pure water and plating additives such as brighteners and wetting agents. Relatively small concentrations of stress-cracking agent may be sufficient to cause cracking.

Mixing and/or dilution of certain chemicals may result in reactions which produce heat which can cause product failure.

Pre-test your specific usage and always follow correct lab safety procedures.

### Caution

**Do not store strong oxidizing agents in plastic labware except that made of TEFLON FEP or PFA. Prolonged exposure causes the material to become brittle.**

We have included a number of resins which are not used in Nunc products, as we feel that customers may find the information useful.

### Resin Codes

<b>ACL</b>	Acetal (polyoxymethylene)	<b>PP</b>	Polypropylene
<b>ECTFE</b>	Halar ECTFE (ethylene-chlorotrifluoroethylene copolymer)	<b>PPCO*</b>	Polypropylene copolymer
<b>ETFE</b>	Tefzel ETFE (ethylene-tetrafluoroethylene)	<b>PS</b>	Polystyrene
<b>FEP</b>	TEFLON FEP (fluorinated ethylene propylene)	<b>PSF</b>	Polysulfone
<b>HDPE</b>	High-density polyethylene	<b>PUR</b>	Polyurethane
<b>LDPE</b>	Low-density polyethylene	<b>PVDF</b>	Polyvinylidene fluoride
<b>NYL</b>	Nylon (polyamide)	<b>TFE</b>	TEFLON TFE (tetrafluoroethylene)
<b>PC</b>	Polycarbonate	<b>TMX</b>	Thermanox
<b>PETG</b>	(Polyethylene terephthalate copolymer)	<b>TPE</b>	Thermoplastic elastomer
<b>PFA</b>	TEFLON PFA (perfluoroalkoxy)	<b>PMX</b>	Permanox
<b>PMMA</b>	Polymethyl methacrylate (acrylic)	<b>XLPE</b>	Cross-linked high-density polyethylene

\*PPCO has replaced polyallomer (PA) in all products.

## Physical Properties of Nunc Products

	Max. Use Temp (°C)	Transparency	Microwave-ability <sup>1</sup>	Auto-claving	Sterilization <sup>3</sup>					Specific Gravity	Flexibility	Permeability Coefficient		
					Gas	Dry Heat	Radiation	Disinfectants	Units: $\frac{\text{ml} \cdot \text{mm}}{\text{sec} \cdot \text{cm}^2 \cdot \text{cmHg}} \times 10^{-10}$			$\text{N}_2$	$\text{O}_2$	$\text{CO}_2$
ACL	121	Opaque	Marginal <sup>2</sup>	Yes <sup>4</sup>	Yes	No	No	Yes	1.43	rigid	0.2	0.4	1.6

PMX	180													

<sup>1</sup> Ratings are based on 5-minute tests at 100% power (600 watts) of exposed, empty labware.  
CAUTION: Do not exceed Max. Use Temp., above, or expose labware to chemicals which heating may cause to attack the plastic or be rapidly absorbed.

<sup>2</sup> Plastic will absorb heat.

<sup>3</sup> Sterilization:  
Autoclaving (121°C, 15 psi for 20 minutes) - Clean and rinse item with distilled water before autoclaving. Certain chemicals which have no appreciable effect on resins at room temperature may cause deterioration at autoclaving temperatures unless removed with distilled water beforehand. (Always completely disengage threads before autoclaving).

Gas - Ethylene oxide formaldehyde.  
Dry heat (160°C, 120 minutes)  
Disinfectants - Benzalkonium chloride, formalin, ethanol, etc. Radiation - gamma irradiation at 2.5 (Mrad) with unstabilized plastic.

<sup>4</sup> Sterilizing reduces mechanical strength. Do not use PC vessels for vacuum applications if they have been autoclaved.
